

Problems to solved

- ① Form differential equation by eliminating  $a, b, c$  from  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ .
- ② Form a partial differential equation by eliminating function  $f$  and  $F$  from  $z = f(x+iy) + F(x-iy)$
- ③ Form differential equation by eliminating the arbitrary constants.
 

(a) $z = ax + a^2y^2 + b$	(b) $z = ax + by + ab$
(c) $az + b = a^2x + y$	(d) $z = a(x+y) + b$
- ④ Form differential equation by eliminating arbitrary functions
 

(a) $z = F(x^2 + y^2)$	(b) $z = e^{my} \phi(x-y)$
(c) $z = f(x) + x g(y)$	(d) $f(x+y+z, x^2 + y^2 - z^2) = 0$

SOME DEFINITIONS

- ① Complete Integral: If from the partial differential equation  $f(x, y, z, p, q) = 0$ , we can find a relation  $F(x, y, z, a, b) = 0$  which contains as many arbitrary constant as there are independent variables, the relation  $F(x, y, z, a, b) = 0$  is called complete integral of the given differential eqn.
- ② Particular Integral: If some particular values are assigned to the arbitrary constants occurring in complete integral, we get particular solution.
- ③ Singular Integral: The equation of envelop of the surfaces represented by the complete integral, of given partial differential equation is called singular integral.
- ④

④ General Integral: If two functions  $u$  &  $v$  of  $x, y, z$  are connected by arbitrary function  $f(u, v) = 0$  then eliminating  $f$  we get partial differential equation of the form  $P_p + Q_q = R$ . — ①

The solution of eqn ① is  $f(u, v) = 0$  which is called general integral of partial differential eqn.

### Lagrange's Linear Equation

A partial differential equation of the form  $P_p + Q_q = R$  where  $P, Q$  &  $R$  are functions of  $x, y$  &  $z$  is called Lagrange's Linear Equation.

### Lagrange's solution of the Linear Equation

We know that, by eliminating  $f$  from  $f(u, v) = 0$  we get the partial differential eqn  $P_p + Q_q = R$  — ②

$$\text{Where } P = \frac{\partial u}{\partial y} \frac{\partial v}{\partial z} - \frac{\partial u}{\partial z} \frac{\partial v}{\partial y}$$

$$Q = \frac{\partial u}{\partial z} \frac{\partial v}{\partial x} - \frac{\partial u}{\partial x} \frac{\partial v}{\partial z}$$

$$R = \frac{\partial u}{\partial x} \frac{\partial v}{\partial y} - \frac{\partial u}{\partial y} \frac{\partial v}{\partial x}$$

Thus  $f(u, v) = 0$  is general integral of  $P_p + Q_q = R$ . So find general integral we need to find  $u$  &  $v$ .

Let  $u=a$  and  $v=b$  be two equations where  $a$  &  $b$  are arbitrary constants.

Differentiating these two eqns we get

$$\frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz = 0 \quad \text{--- ③}$$

$$\text{& } \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy + \frac{\partial v}{\partial z} dz = 0 \quad \text{--- ④}$$

Solving eqn ③ & ④ we get

$$\frac{dx}{\frac{\partial u}{\partial y} \cdot \frac{\partial v}{\partial z} - \frac{\partial u}{\partial z} \cdot \frac{\partial v}{\partial y}} = \frac{dy}{\frac{\partial u}{\partial z} \cdot \frac{\partial v}{\partial x} - \frac{\partial u}{\partial x} \cdot \frac{\partial v}{\partial z}} = \frac{dz}{\frac{\partial u}{\partial x} \cdot \frac{\partial v}{\partial y} - \frac{\partial u}{\partial y} \cdot \frac{\partial v}{\partial x}}$$

i.e we get  $\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R}$  —— ⑤

On solving above simultaneous differential equations  
we get  $u=a$  &  $v=b$ .

Thus solution of eqn ② is found as  $f(u, v)=0$

The eqns ⑤ are called Lagrange's Auxiliary Equations or subsidiary eqn.

So Working Method is:

To find the solution of partial differential equation  $Pp + Qq = R$  —①

we form auxiliary equation  $\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R}$  —②

We find two independent integrals of auxiliary equations ② in the form  $u=a$  &  $v=b$ .

Then the general integral is given by

$$f(u, v) = 0$$

where  $f$  is arbitrary function.

Geometrical Interpretation of Lagrange's Linear

Equations:

The equation  $Pp + Qq = R$  and  $\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R}$  define the same set of surfaces, and are thus equivalent.
